			1143 Saddle
9 Lots	10 Lots	10 Lots	9 Lots

This 2007 schedule is identical to last year's, but please check your address and schedule days to be sure. Our watering allotment allows each of us to water two times per week for a total amount of 1.5 inches per week, assuming no water shortages develop. Please follow the schedule.

As the total average water supplied at our weir is 360 gallons per minute, and since pressure problems can arise if too many homeowners try to water at the same time, we have provided this schedule which spreads out our usage so as to minimize pressure problems, assuming we do not run out of water. The schedule divides us into several groups in order to insure sufficient irrigation water pressure, as dictated by the size of our irrigation pipes. Even though some of these pipes are 6 inches in diameter, no more than about 1/3 of us can water at the same time in order for there to be adequate pressure to run our sprinkler systems.

Greenbelt watering is spread out over the week, often in the afternoon, so as not to interfere too much with individual homeowner's watering slots.

Drip watering can be done at any time. Spot watering with individual sprinkler and a hose can also be done on brown spots at any time. This should not include running sections of your automatic sprinkler system.

We will keep you informed if water allotment needs to be reduced, or if water is shut c

For WATER PRESSURE problems, please check your inlet filter, then call KID at 586-9111. Thank you for your cooperation. If questions, please call Steve Dension at 628-9128.
